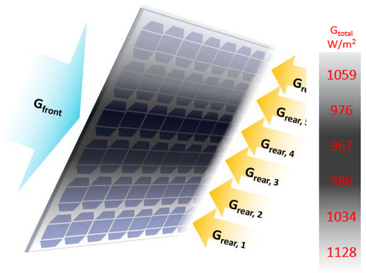
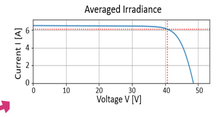
Carlos Olalla , Rovira I Virgili University, Tarragona

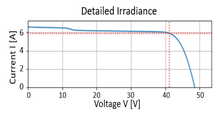
Nonuniform rear-irradiance on bifacial PV systems can cause additional **mismatch loss,** which may not be appropriately captured in PV energy production estimates and software.



Averaging Irradiance for the module ~1031 W/m²



P_0



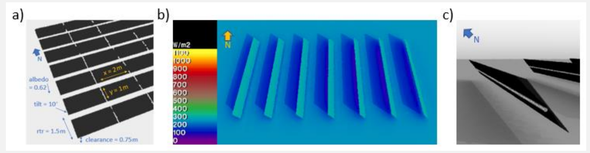
P_1

Detailed Irradiance value

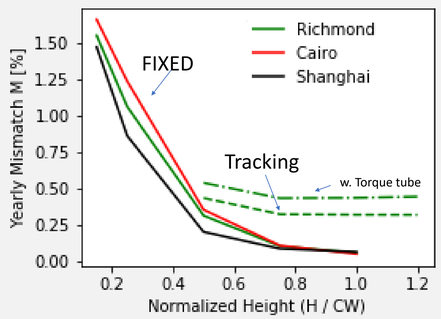
$$L_{DC} = M = 1 - \frac{P_1}{P_0}$$

Simulations: Fixed Tilt + Tracking + Tracking w TT

System	Height	Albedo	GCR	Tilt	# modules
Rooftop	0.15 – 1 m	0.62	0.67	10°	1-landscape
Tracking	1.0 – 2.4 m	0.2	0.33	--	1-portrait



Annual mismatch loss %

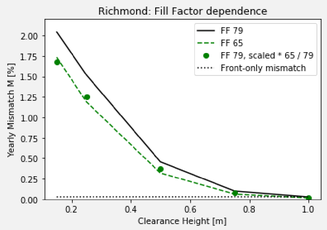


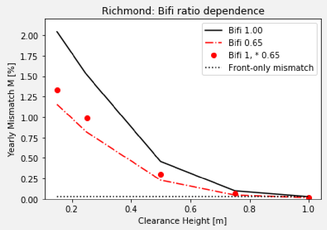
Slight climate dependence is visible for the high-albedo rooftop simulations
For HSAT simulations, the effect of climate was similarly modest but reversed from what was is shown in the high-albedo rooftop simulations, possibly due to the greater influence of diffuse irradiance in a low-albedo tracking scenario.

Fill Factor and Bifaciality Factor dependency

Modules exhibiting lower FF are susceptible to reduced mismatch loss. This is expected due to the smaller slope *-dP/dI* in low-FF modules.

Sample mismatch curves calculated for fixed values of *FF* and ϕ_{Bifi} can be applied more generally due to a linear dependence.





$$M[\%]_{FF1} = M[\%]_{FF_0}\frac{FF_1}{FF_0}$$

$$M[\%]_{\phi_{Bifi,1}} = M[\%]_{\phi_{Bifi,0}}\frac{\phi_{Bifi,1}}{\phi_{Bifi,0}}$$

Reduced Order Model

A simplified empirical relationship was found that links the spatial variation of irradiance (to the resulting mismatch loss factor

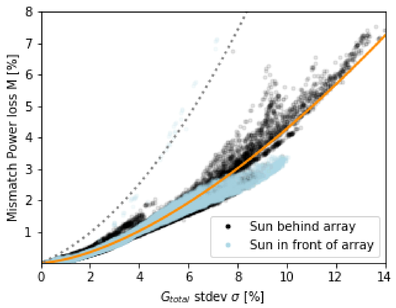
Stdev

$$\sigma[\%] = \frac{1}{\bar{G}_{total}}\sqrt{\frac{\Sigma(G_{total,i}-\bar{G}_{total})^2}{n-1}}\ \text{x } 100\%$$

MAD Mean absolute difference

$$\Delta[\%] = \frac{1}{n^2\bar{G}_{total}}\sum_{i=1}^{n}\sum_{j=1}^{n}\left|G_{total,i} - G_{total,j}\right|\ \text{x } 100\%$$

Irradiance distribution vs. Power Mismatch, Fixed



Hourly simulation showing power mismatch M[%] as a function of Gtotal spatial standard deviation. Two overlaying fits and a comparison fit from Janssen et al shown.

$$M[\%]_{Fit1} = e^{1.57\ *\ln(\sigma[\%])-2.2}$$

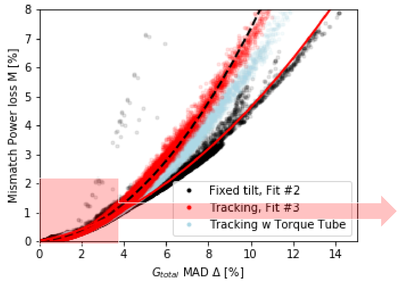
$$M[\%]_{Fit2} = 0.15\,\sigma[\%] + 0.027\,\sigma[\%]^2$$

Janssen et al, «Impact of inhomogeneous irradiance at the rear of bifacial panels on modelled energy yield» EUPVSEC

$$M[\%]_{\text{Janssen}} = 0.33\,\sigma[\%] + 0.0745\,\sigma[\%]^2$$

Irradiance distribution vs. Power Mismatch, Tracking

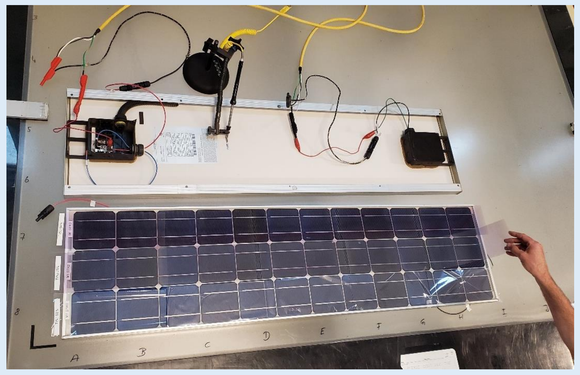
For the two tracking scenarios, results do not fall directly in line with the curves established for fixed-tilt simulations.



Similar curve form, but different empirical-fit parameters.

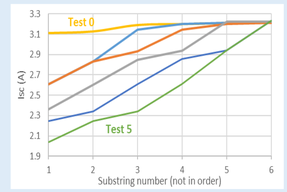
Agreement is much better at $\Delta < 4$, where bulk of the energy is at.

Experimental Validation

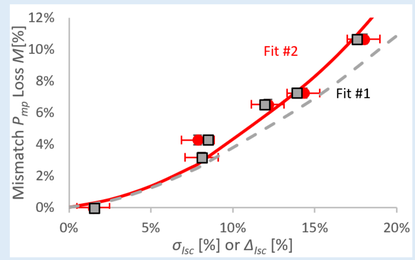


A Spire 4600 long-pulse flash I-V curve simulator was used, along with two Siemens SM55 36-cell monocrystalline modules (mono-facial, FF = 0.7) to investigate the effect of irradiance mimsatch using filters to achieve artificial shading.

Test#	M1 str1 (%)	M1 str2 (%)	M1 str3 (%)	M2 str1 (%)	M2 str2 (%)	M2 str3 (%)
0	-	-	-	-	-	-
1	90	-	84	-	-	-
2	90	-	84	-	-	90
3	90	7	84	-	-	90
4	90	75	84	70	-	90
5	64	75	84	70	-	90



Measured substring I_{sc} for each of the shading tests



Measured mismatch loss *M*[%] for each of the shading tests vs σ_{Isc} or Δ_{Isc} which have similar value in this experiment.
Empirical models shown for comparison using the same coefficients given in Fit 1 and 2, adjusted for FF.

Application to Performance Models

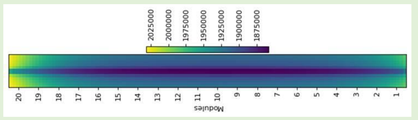
Mismatch loss factors for bifacial or monofacial simulations are considered by a single annual DC loss factor *X*, applied after array power is calculated. This value is often ~10x higher than system-level mismatch numbers shown here.

$$P_0 = \left(G_{F_0} + G_{R_0}\cdot\varphi\right)\cdot\eta_0$$

$$P_1 = \left(G_{F_0} + G_{R_0}\cdot\varphi\right)\cdot\eta_0\cdot(1-M)$$

$$P_1 = \left(G_{F_0} + (1-L_{Rear})G_{R_0}\cdot\varphi\right)\cdot\eta_0$$

$$L_{Rear} = \frac{M}{BG} + M \qquad L_{Rear} = L_{Inherent\ \text{Mismatch}} + L_{Structural\ Shading}$$



Future steps: explore edge effects on additional mismatch losses. (i.e. 6% annually for HSAT case at 0.75 H.)
